

ENET Insights
Newsletter, July 2019

Summer is here, and before some of us leave on our vacations, we want to share the exciting developments for Ethernity Networks and in our industry, in this, our latest edition of ENET Insights!

First, the release of our new ENET Universal Edge Platform (UEP), which is garnering much interest from system integrators and hardware vendors who recognize that the UEP can provide affordable, programmable, high performance Ethernet access at the network edge, whether as a NID, as a DPU or MDU, or as a 5G Cell Site Router. And second, the announcement of an exciting new partnership with Chinese telecommunications and networking equipment provider FiberHome to integrate our ACE-NIC100 into their new FitBNG product, providing acceleration and offloading that will help them (and their Chinese operator customers) to stop burning CPU cores.

Amid all the excitement around here, we are pleased to have the opportunity to share our thoughts, insights, and unique view of the topics that affect Ethernity and its many customers and partners.

We hope you'll enjoy the content we have collected below and find it useful. If you have feedback, questions, or suggestions, please feel free to contact me at liorm@ethernitynet.com.

All the best,

Lior Mishan,
Head of Marketing
